

Welcome

...to the 3rd edition of the Guard-Alert Gazette. Thank you for all the positive feedback and constructive advice. This edition of Guard-Alert Gazette focuses on the newest products in the Guard Alert Electronics portfolio, the Vehicle Tracking as well as the Geo Vision Monitoring amongst other articles. Read on....

GAE Vehicle Satellite Tracking

Guard-Alert Electronics is proud to unveil the **GAE Vehicle Satellite tracking**, one of the newest products in its electronic security products portfolio.

The Vehicle tracking Unit is an internet based GPS/ GSM/ GPRS device that allows one to track vehicles at any time of the day in real time. The GAE Vehicle Tracking Unit is suitable for any size of vehicle from motorcycles right up to heavy transport.

The number of monitored vehicles is dependent on the client's requirements as a large number of vehicles can be accommodated on the system.

The features of the vehicle tracking system include:

- **Real Time and Historical Tracking:** Shows the exact location of the vehicle on a street level map and includes the vehicle's speed, kilometres travelled and duration of stops
- **Speed Alert:** Indicates if the vehicle exceeds a pre programmed speed limit
- **Battery Disconnect Alert:** Indicates if the vehicle battery is disconnected
- **Vehicle Stop Report:** monitors when vehicle is either on the move or stationary
- **Geo Fencing:** Indicates if the vehicle leaves pre-defined areas
- **Remote Engine Cut Off / Restart:** Allows the vehicle engine to be remotely cut off in the event of a vehicle theft etc
- **Panic Button:** Can be activated by the Driver should assistance be required- connected to the GAE control room
- **Monitoring:** Can be monitored from either your PC or smart phone

Geovision off site CCTV monitoring system

Guard-Alert Electronics is pleased to announce the introduction of the Geovision real time off site CCTV monitoring system which is cutting edge surveillance technology. The system can be adapted for all types of locations from small residences to large complexes such as factories, container depots, warehouses.

In order to get the Geovision, GAE will install an intruder alarm onsite with perimeter protection via sensors and or beams. CCTV cameras will be strategically placed to ensure a full view of the premises. A public address speaker will also be installed. The complete system will then be linked to the onsite Geovision server, which with the use of a reliable high speed internet connection will enable visuals from the cameras to be sent through to the Guard-Alert

Electronics Control Room within a few seconds of the alarm being triggered.

The Control Room Operator is then able to quickly determine the cause of the activation. If indeed the activation is as a result of entry by an intruder, in addition to the immediate dispatch of a Rapid Response vehicle and crew the Operator is able to convey audible instructions via the PA system to the intruder/s warning that they are being watched and recorded and the

Reaction Crew will be on site soon.

Features and advantages

- ***Existing alarm systems and CCTV cameras can be utilised with Geovision.***
- ***Alarms can be remotely armed and disarmed.***
- ***All events on site are recorded 24/7 to allow for historical viewing if required.***
- ***The system will allow for selected users to view both live and recorded images anywhere in the world.***
- ***Monitoring fees are significantly lower than the cost of employing guards.***

Get your SMS Module today

Guard Alert Electronics is currently offering SMS Rapid Response to complement its Radio link Radio Response System whose main advantage is that it is not limited by geographic spread and location unlike the Radio Link system.

This innovative product can therefore be used wherever there is telecommunication signal from any one of our three network operators. Guard-Alert Electronics can respond effectively through SMS notifications, and one can be informed when the alarm has been activated or de-activated. The notifications can be programmed to be sent to selected recipients. Up to eight contacts can be programmed to receive SMS Notifications and this means that not only Guard Alert, but the client and designated individuals will always be aware of developments on site.

The SMS Module can also be installed into any existing

alarm system, ensuring that even when one is away from the premises they can benefit from the Guard-Alert Electronics Rapid Response service.

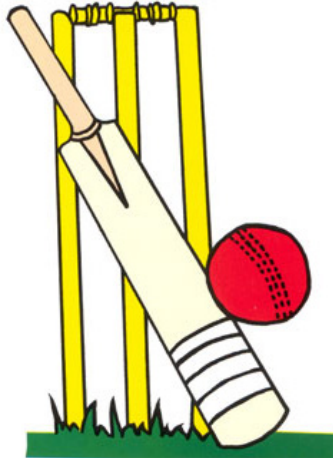

How about when one does not even have an alarm system?

The SMS Module can be installed as a stand-alone SMS Panic Alarm system should there not be a full alarm system.

Guard Alert Electronics will install a fixed panic button, positioned strategically, which one can press when under duress or threat. The SMS will come through the GAE control room prompting the controller to dispatch a vehicle to render assistance.

So get a SMS-Based Rapid Response System installed today

Howzat- Guard-Alert Sponsors cricket

Guard-Alert security provided security at one of the Cricket tours Africa events in Zimbabwe held in Kwekwe during the weekend of the 27th-29th of September. This was the third year that the tournament was held and it is getting bigger and better every year.

The tournament held at Kwekwe Sports Club attracted a field of 16 teams of 8 team members each and these were drawn from all over Zimbabwe.

The ample security provided by Guard-Alert security ensured that the event was held with no mishaps and this turned out to be a weekend of fun for the whole family as well as being highly entertaining sports wise. It

is no wonder then that Guard-Alert Security is known as the security company of choice when it comes to events and functions.

Crime Corner

A retail shop worker stored the day's takings in an unlockable safe at the end of the day. The next day, it was discovered that the shop had been "broken" into as evidenced by some of the shop's wares scattered in the shop as well as the empty safe. No evidence of a break in was detected however, leading to the conclusion that this might have been an inside job. Business owners are therefore urged to ensure that they have a well secured safe which is lockable. The keys to the safe should be held by trusted key holders. It would also be wise to have a thorough search of the shop to detect if anyone is left hiding in the shop.

Vehicle owners are once again advised that hiding objects of value underneath the seat in public parking areas is not adequate security at all. Thieves seem to have an uncanny ability to "sniff-out" valuables left in the car, even if these are out of sight. Motorists are advised to carry valuables with them when they disembark from the vehicle, or if not possible to lock the valuables in the boot. It is better to lock the valuables in the boot away from the place where you will be parking your vehicle so that your movements are not being detected.

Outside sensors at your home are fast becoming a necessity so that thieves will be detected as they approach your office or house. This will ensure safety for your family as it is fast becoming obvious that the thieves who are breaking into our homes are becoming more and more violent. The alarm should be linked to the Rapid Response service so that the reaction crew can react quickly to the raised alarm. With the ever lengthening load shedding

hours, homeowners are advised to invest in a good battery back-up system so that you are not affected by the lengthy power outages period.

The warm summer nights mean that householders will want to keep their doors and windows open longer. House owners are advised that they should

keep their grill gates locked if they want to keep their doors open. That way, one will be able to enjoy the fresh air and at the same time feel secure in the home. Sleeping with windows open should be a last option as thieves have been known to gas the house occupants with a sleeping gas and after that have the leisure to raid the house as the house occupants are drugged to sleep.
